

WHAT IS CLAIMED IS:

1. A high-voltage equipment housing holding high-voltage equipment therein, comprising:
 - connection means for making an electrical connection between external equipment located outside said high-voltage equipment housing
 - 5 and said high-voltage equipment;
 - attaching means for attaching said connection means to prevent a mechanical connection of said connection means from being released by said connection means only; and
 - changing means for changing a state of the electrical connection
 - 10 between said high-voltage equipment and said external equipment by means of said connection means to a disconnected state in response to detachment of said attaching means.
2. The high-voltage equipment housing according to claim 1, wherein
 - said changing means includes an interlock circuit attached to said attaching means and a circuit changing said state of the electrical
 - 5 connection to said disconnected state when said interlock circuit opens in response to detachment of said attaching means.
3. The high-voltage equipment housing according to claim 1, further comprising:
 - an upper lid for preventing said high-voltage equipment from being touched; and
 - 5 prevention means connected to said attaching means for preventing said upper lid from being attached/detached by said upper lid only.
4. The high-voltage equipment housing according to claim 2, further comprising:
 - an upper lid for preventing said high-voltage equipment from being touched; and

5 prevention means connected to said attaching means for preventing said upper lid from being attached/detached by said upper lid only.

5. The high-voltage equipment housing according to claim 1, further comprising holding means for mounting said high-voltage equipment housing on a vehicle.

6. The high-voltage equipment housing according to claim 2, further comprising holding means for mounting said high-voltage equipment housing on a vehicle.

7. The high-voltage equipment housing according to claim 3, further comprising holding means for mounting said high-voltage equipment housing on a vehicle.

8. The high-voltage equipment housing according to claim 4, further comprising holding means for mounting said high-voltage equipment housing on a vehicle.

9. The high-voltage equipment housing according to any of claims 1-8, wherein said connection means is placed at a position touchable by a hand of a person.

10. A high-voltage connector making an electrical connection between high-voltage equipment and another equipment different from said high-voltage equipment, comprising:

5 connection means for mechanically establishing said electrical connection; and

changing means for changing a state of the electrical connection between said high-voltage equipment and said another equipment to a disconnected state in response to release of the mechanical connection by means of said connection means.

11. The high-voltage connector according to claim 10, wherein
said changing means includes an interlock circuit attached to said
connector and a circuit changing said state of the electrical connection to
said disconnected state when said interlock circuit opens in response to
5 release of the mechanical connection by said connection means.

12. The high-voltage connector according to claim 10 or 11, wherein
said connection means is placed at a position touchable by a hand of
a person.

13. A high-voltage equipment housing holding high-voltage
equipment therein, comprising:

a connection unit making an electrical connection between external
equipment located outside said high-voltage equipment housing and said
5 high-voltage equipment;

an attaching unit attaching said connection unit to prevent a
mechanical connection of said connection unit from being released by said
connection unit only; and

a changing unit changing a state of the electrical connection between
10 said high-voltage equipment and said external equipment by means of said
connection unit to a disconnected state in response to detachment of said
attaching unit.

14. The high-voltage equipment housing according to claim 13,
wherein

said changing unit includes an interlock circuit attached to said
attaching unit and a circuit changing said state of the electrical connection
5 to said disconnected state when said interlock circuit opens in response to
detachment of said attaching unit.

15. The high-voltage equipment housing according to claim 13,
further comprising:
an upper lid for preventing said high-voltage equipment from being

touched; and

- 5 a prevention unit connected to said attaching unit to prevent said upper lid from being attached/detached by said upper lid only.

16. The high-voltage equipment housing according to claim 14, further comprising:

 an upper lid for preventing said high-voltage equipment from being touched; and

- 5 a prevention unit connected to said attaching unit to prevent said upper lid from being attached/detached by said upper lid only.

17. The high-voltage equipment housing according to claim 13, further comprising a holding unit for mounting said high-voltage equipment housing on a vehicle.

18. The high-voltage equipment housing according to claim 14, further comprising a holding unit for mounting said high-voltage equipment housing on a vehicle.

19. The high-voltage equipment housing according to claim 15, further comprising a holding unit for mounting said high-voltage equipment housing on a vehicle.

20. The high-voltage equipment housing according to claim 16, further comprising a holding unit for mounting said high-voltage equipment housing on a vehicle.

21. The high-voltage equipment housing according to any of claims 13-20, wherein
said connection unit is placed at a position touchable by a hand of a person.

22. A high-voltage connector making an electrical connection

between high-voltage equipment and another equipment different from said high-voltage equipment, comprising:

5 a connection unit mechanically establishing said electrical connection; and

a changing unit changing a state of the electrical connection between said high-voltage equipment and said another equipment to a disconnected state in response to release of the mechanical connection by means of said connection unit.

23. The high-voltage connector according to claim 22, wherein
said changing unit includes an interlock circuit attached to said
connector and a circuit changing said state of the electrical connection to
said disconnected state when said interlock circuit opens in response to
5 release of the mechanical connection by said connection unit.

24. The high-voltage connector according to claim 22 or 23, wherein
said connection unit is placed at a position touchable by a hand of a
person.
